Meet Huda

Huda Elasaad and PV Pure (www.pvpure.com)

Huda is co-founder and chief science officer at PV Pure. She has an undergraduate degree from McGill University in Canada, where she studied geohydrology and aquatic chemistry, and also has a master's degree from the University of Michigan. Huda has worked on solving water-related challenges across the world—from the United States to Mexico, from the Middle East to Africa. Huda grew up in Egypt near the Nile—one of the most important water sources in the world. She also teaches swimming because she loves the water so much and wants to share it with everyone.

PV Pure is a company that is focused on making sure all communities—no matter how small—have access to safe drinking water. They design simple, modular water purification plants that are easy to operate and are powered by solar power. PV Pure is a rewarding place to work because there is such a huge need to provide clean drinking water to so many places.

Environmental technology is an exciting field in general that is always changing and has the potential to make a big difference in the world.

Read or discuss the information about PV Pure (both from the video and this passage). What do you think is the coolest or most interesting thing about Huda or PV Pure?
